[EMA – Heiken Ashi – RSI] How to Combine Indicators for High-Probability Trading Signals (Step-by-Step Breakdown)

THIS IS THE MOMENT WHERE EVERYTHING CLICKS.

This is where indicators stop being theory and start producing **real, high-probability trades**. If you've ever wondered *how professionals actually execute trades*, pay close attention — this is it.

In this section, we're combining **all key indicators** and applying **strict trading rules** to hunt for the exact same high-probability setups shown at the beginning of the video. No guessing. No improvising. Just structure, confirmation, and execution.

Let's break this chart down step by step.

Step 1: Identifying a Sideways Market (No Trade Zone)

At this point on the chart, the strategy gives **NO BUY and NO SELL signal**. Nothing. Zero entries.

Why?

Because the **support and resistance zones are completely flat**. This instantly tells us the market is in a **SIDEWAYS condition**. And here's a critical rule:

When the market is sideways, this strategy does NOT trade. Period.

No forcing trades.

No emotional entries.

No gambling.

This single filter alone saves traders from countless unnecessary losses.

Step 2: Trend Shift Confirmation Using Support & Resistance Zones

Now watch what happens next.

Price begins to move downward, and the support and resistance zones start to **tilt downward**. This is our **first major confirmation** that the market is transitioning into a **bearish trend**.

Zoom out and analyze market structure, and the picture becomes even clearer:

- **Lower Highs**
- **Lower Lows**

This is classic bearish market behavior. The trend is no longer neutral — it's directional.

Step 3: RSI Confirms Momentum Direction

Next, we bring in the **RSI (Relative Strength Index)**.

Earlier, during the sideways phase, the RSI hovered around the **50 level**, moving up and down without commitment. That's a massive red flag — it tells us momentum is weak and undecided.

In this condition:

Any Heiken Ashi signal is automatically rejected.

This is where discipline protects your account.

But now... everything changes.

As price moves forward, the RSI starts pushing **downward, clearly below 50**. This is huge. It means:

- Momentum is building
- Sellers are stepping in with strength
- The market has made a decision

Step 4: Pullback vs Reversal — Reading Heiken Ashi Correctly

Next, price moves upward temporarily, and **Heiken Ashi candles turn green**, pushing price back toward the support and resistance zones.

This is the moment where most beginners panic:

- “Is the trend reversing?”
- “Should I buy here?”

But we don’t panic.

We follow the rules.

When price pulls back toward the zones, the **only thing that matters is RSI**. And here’s the key detail:

Even as price reaches the zone, **RSI stays well below 50**

This confirms the move upward is **just a pullback**, not a reversal. The bearish momentum is still intact.

Step 5: High-Probability SELL Signal Execution

Then it happens.

The **Heiken Ashi candle flips from green to red**.

THIS IS THE SELL SIGNAL.

This setup gives us:

- High-probability entry
- Very tight stop loss
- Massive reward potential

No hesitation.

No second-guessing.

We execute the **SELL at the opening of the next candle**.

And then...

BOOM.

Price drops hard.

Fast.

Clean.

Exactly as the strategy predicts.

Why This Strategy Works Consistently

This is not luck.

This is not guessing.

This is **a system doing exactly what it's designed to do.**

Once you understand this flow:

- Sideways market filter
- Trend confirmation
- RSI momentum validation
- Heiken Ashi entry timing

You stop chasing trades — and start letting **the market come to you.**

This is how **precision trading** is done.

This is how professionals stay consistent.

Low-Risk “Forex & Stock Market” Trading with EMA and Parabolic SAR indicator .

The nice thing about the Parabolic SAR is that it is really simple to use. We mean REALLY simple. Basically, when the dots are below the candles, it is a BUY signal. When the dots are above the candles, it is a SELL signal.

This is probably the easiest indicator to interpret because it assumes that the price is either going up or down. With that said, this tool is best used in markets that are trending, and that have long rallies and downturns.

You DON'T want to use this tool in a choppy market where the price movement is sideways.

“EMA – Parabolic SAR” Trading Strategy

This strategy can be used on any time frame on your chart. So day traders, swing traders, and scalpers are all welcome to use this type of strategy.

Here are the indicators you need to apply on your chart to use this trading strategy:

- **Parabolic SAR indicator:** Default Settings.
- **40-period Exponential Moving Average** = Blue color in our example
- **20-period Exponential Moving Average** = lime color in our example

This “EMA Parabolic SAR” trading strategy will show you how to use the parabolic SAR indicator effectively and how you can add this trading system into your daily trading techniques.

- Copy mq4 and ex4 files to your Metatrader Directory .../experts/indicators/
- Copy the “TraderVersity-EMApabolicSAR.tpl” file (template) to your Metatrader Directory .../templates /
- Start or restart your Metatrader Client.
- Select Chart and Timeframe where you want to test your forex system.
- Right-click on your trading chart and hover on “Template”.
- You will see the “” system is available on your Chart.

BUY Setup

When seeking to open buy positions, observe indicator readings as follows:

- Rule number 1: Apply Parabolic SAR and Moving Average indicators to your chart.
- Rule number 2: The moving averages must cross over.
In a long trade, the 20 period moving average will cross and go above the 40 periods moving average.
- Rule number 3: The Parabolic SAR Indicator must change to be below price candle.
 - Notice how the dots were above the price. The parabolic SAR formula showed us that the price stalled out for a few candles and then the dot appeared below the candle. This is a sign that a reversal may be forming.
 - Since the moving averages are telling us that a downtrend is most likely going to occur, we will wait until the dot appears again below price candle to validate this reversal and enter a trade.
- Rule number 4: Parabolic SAR dot must be below price candle AND moving averages cross to where 20 period MA is above 40 period MA.
Note** One of these elements may occur before the other. The reversal dot can appear before the MA lines cross. Or the Moving averages can cross before the reversal candle. As long as there are both elements, the entry criteria are met.
- Rule number 5: Enter The Next Price Candle.
Enter BUY the very next price candle after the dot appears below the candle.
- Rule number 6: Stop loss / Take Profit
Simply set and move your stop-loss to the price level of each dot in the direction of your trade.

SELL Setup

When seeking to open sell positions, observe indicator readings as follows:

- Rule number 1: Apply Parabolic SAR and Moving Average indicators to your chart.
- Rule number 2: The moving averages must cross over.
In a short trade, the 20 period moving average will cross and go below the 40 periods moving average.
- Rule number 3: The Parabolic SAR Indicator must change to be above price candle.
 - Notice how the dots were below the price. The parabolic SAR formula showed us that the price stalled out for a few candles and then the dot appeared above the candle. This is a sign that a reversal may be forming.
 - Since the moving averages are telling us that an uptrend is most likely going to occur, we will wait until the dot appears again above price candle to validate this reversal and enter a trade.
- Rule number 4: Parabolic SAR dot must be above price candle AND moving averages cross to where 20 period MA is below 40 period MA.
Note** One of these elements may occur before the other. The reversal dot can appear before the MA lines cross. Or the Moving averages can cross before the reversal candle. As long as there are both elements, the entry criteria are met.
- Rule number 5: Enter The Next Price Candle.
Enter SELL the very next price candle after the dot appears above the candle.
- Rule number 6: Stop loss / Take Profit
Simply set and move your stop-loss to the price level of each dot in the direction of your trade.

Trading NOTES

No strategy can give you a 100% win ratio so always be placing your stops at the appropriate areas. I would recommend practicing making both short and long trades with this EMA Parabolic SAR trading strategy.

QQE Trend Color Histogram MT4 Indicator & Trading Strategy

The **QQE Trend Color Histogram Strategy** is a trend momentum strategy based on trend arrow filtered by Trender Color Histogram and QQE.

This is a very easy and simple strategy.

- **TimeFrames:** M5, M15, M30, H1, H4 or higher
- **Currency Pairs:** Majors Pairs, Minors, Indices, Gold

MetaTrader Trading Indicators

- QQE
- Trend Histogram
- Trend arrow (3, 12, 2)
- StepMA
- Trend Buzzer

BUY Rules

- QQE Bullish (*white line above blue line*)
- Trend Histogram green color and above zero
Trend Histogram Color (Red down momentum, yellow flat momentum, green uptrend momentum)
- Trend arrow (3, 12, 2) BUY
- StepMA lime color
- Trend Buzzer lime color

SELL Rules

- QQE Bearish (*white line below red line*)
- Trend Histogram red color and below zero
Trend Histogram Color (Red down momentum, yellow flat momentum, green uptrend momentum)
- Trend arrow (3, 12, 2) SELL
- StepMA orange color
- Trend Buzzer orange color

Trading NOTES

Trend Histogram color is an indicator that you can use also for contrarian trading but this is not the purpose of the trading system.

Exit at the opposite trend arrow or with profit target predetermined.

Take the initial stop loss on the previous swing low for BUY or previous swing high for SELL.

MATRIX-PRO Trend Momentum System

This “**Forex MATRIX PRO Trend and Momentum Trading System**” all about catching and predicting Trend....just look at all images and the trading rules you will know how easy to define the trend and predict the next trend or change of trend....

- **Time Frame:** M30 or higher
- **Currency Pairs:** Any

MetaTrader Trading Indicators

- Matrix SDC
- Matrix VCS
- Matrix Trend Alex
- Matrix FXTraderPro Trend or Range
- Filter
- Commodity Channel Index
- VH

How to install “**MATRIX PRO Trend Momentum System**”

- Copy mq4 and ex4 files to your Metatrader Directory .../experts/indicators/
- Copy the “TraderVersity.Com-MATRIXPRO.tpl” file (template) to your Metatrader Directory .../templates /
- Start or restart your Meta Trader Client.
- Select Chart and Time frame where you want to test your Forex system.
- Right-click on your trading chart and hover on “Template”.
- Move right to select “TraderVersity.Com-MATRIXPRO” trading system and strategy
- You will see “**MATRIX PRO TrendMomentum System**” is available on your Chart

BUY Rules

- SDC = UPTrend
- SMA = UpTrend
- VCS (*Volty Channel Stop*) = Blue color
- Matrix Trend Alex blue
- Filter indicator blue color
- CCI line above 50 level
- If Pure Up Trend = High Risk with big lot (optional)

SELL Rules

- SDC = DownTrend
- SMA = DownTrend
- VCS (*Volty Channel Stop*) = Red color
- Matrix Trend Alex red
- Filter indicator red color
- CCI line below -50 level
- If Pure DownTrend = High Risk with big lot (optional)

Trading NOTES

If Standard Deviation Channels (SDC) are in the uptrend and SMA (Period 20 with OHLC/4) is in the same direction then I call that a **uptrend** if MA (Trend Alex –at the bottom), FXTraderPro T or R (at the very bottom) and other Indicators (at top right corner) of Different TF is Green I call that a Pure Uptrend....and Vice Versa.....
